

LCC ImmsLink™

A true **bi-directional interface** from Centricity EMR to your state immunization registry

- How much time do your nurses spend entering Immunizations data into your patients' Centricity EMR charts, only to have to enter it again into your state's public registry site?
- How many data entry errors are caused by this double entry system?
- How much valuable time is spent on this double entry requirement that could be put to better use by providing more time to spend on quality patient care?
- Are you sending incomplete immunization records to the registry through your PM billing system?
- What is the cost to public health care by not having complete information, such as lot numbers, manufacturers and expiration dates?

Lost Creek Consulting's ImmsLink program can upload your immunization data to the state registry in two ways. It can provide a log-in function to the registry through the EMR so you can enter the immunizations in real time as you see your patients. Or it can create a batch file of immunizations that you can send to the registry on a schedule you determine, such as nightly, weekly or even monthly.

LCC Immunization Loader Registry Data for Benjamin Peterson, 3/13/2002

The ImmsLink program allows you to directly query the state's immunization registry and do a side by side comparison of the registry records for each individual patient to that patient's local EMR chart. You can then download from the registry any records not yet in the patient's EMR chart, ensuring a complete and accurate record for each patient.

The ImmsLink XRef/Analyzer Tool Kit manages the interface between your EMR and state registry by cross referencing your observation terms and immunization codes with state registry standards.

Contact Lost Creek Consulting, Inc. for more information and to set up a personal demonstration for your clinic
